

HireHub Job Finder System

MCA-401 Software Development Project

Project Overview

HireHub Job Finder System is a web-based job portal developed using Python Django. It connects job seekers with companies and provides job posting, application management, resume upload, search, filtering, email notifications, and dashboard analytics.

Technology Stack

Frontend: HTML, CSS, Bootstrap, JavaScript. Backend: Python Django. Database: MySQL/SQLite. Architecture: Django MVT.

Modules

Company Module, Applicant Module, Admin Module, Resume Upload, Email Notifications, Search & Filters, Dashboard Analytics.

Database Tables

User, Job Post, Application.

Chapter Structure

Introduction, Requirement Analysis, Logical Design, Physical Design, Implementation, Testing, Conclusion, References and Appendix.

Objectives

Provide a centralized recruitment platform, simplify hiring processes, and help applicants discover suitable opportunities.

Future Scope

AI-based job recommendations, interview scheduling, skill assessments, and mobile application support.

Note

This PDF is an initial MCA project report template/synopsis. A complete university-compliant report typically requires 100–125 pages including diagrams, screenshots, testing, database design, DFDs, ER diagrams, and detailed module documentation.
